

Turn on a light using natural gas!

First, we dig wells to extract the  out of the ground. The natural gas then is sent through a small  to a plant where it is burned. The burning natural gas combusts to turn a . The water boils and turns to _____ that rises to turn another

_____. The spinning turbines activate a _____. Inside the generator there is a spool of _____ surrounded by _____. The generator generates

ELECTRICITY! The electricity travels through  into a

. When you turn on a _____ you complete a circuit that sends the electricity to a _____, turning it on!

magnets**natural gas****copper wire****turbine****light bulb****water****house****turbine****turbine****generator****steam****pipeline****transmission lines****light switch**

Real World Example!

In 2020, construction began on the Cascade power plant near Edson, Alberta. It is a combined-cycle gas turbine power plant that will provide power for about 900,000 homes and business in Alberta. It is expected to produce 62% less carbon dioxide (CO_2) per MWh compared to current coal-powered electricity generation facilities.

Turn on a toaster using wind power!

Wind turbines are metal structures that are about _____ metres tall. The power of the

_____ pushes on the giant _____, which spins an internal shaft

connected to a _____. The gears work to increase the speed of _____ by a

factor of 100, which then activates a _____ to produce **ELECTRICITY!**

The higher the wind _____, the more electricity is generated. The electricity travels

through _____ into your home. When you plug in your _____,

through the cord and heat up the wires that are spaced apart to toast your bread!

Real World Example!

Constructed in 2012, Capital Power's Halkirk Wind Farm in East-Central Alberta has 83 wind turbines and produces 150MW of electricity. Capital Power has received approval from the Alberta Utilities Commission (AUC) to develop Halkirk 2, a second wind farm that will install another 74 turbines in the same area.
